1 Subject of this Technical Protocol

This protocol applies to hybrid varieties of *Beta vulgaris* L. ssp. *vulgaris* var. *saccharifera* Alef. (syn. *Beta vulgaris* L. ssp. *vulgaris* var. *altissima* Döll).

2 Material Required

The material is to be supplied in the form of naked untreated seed.

The minimum quantity of plant material, to be supplied by the applicant, should be: 350 g of seed

The applicant is responsible for ensuring compliance with any customs, transportation and plant health requirements.

The plant material supplied should be visibly healthy, vigorous, and not affected by any seedborne diseases or pests.

3 Method of Examination

3.1 Number of Growing Cycles

The minimum duration of tests is two independent growing cycles.

3.2 Testing Location

Tests are normally conducted at TystofteFoundation.

3.3 Conditions for Conducting the Examination

The tests are carried out under conditions ensuring satisfactory growth for the expression of the relevant characteristics of the variety and for the conduct of the examination.

The optimum stage of development for the assessment of each characteristic is indicated by a number in the Table of Characteristics (Chapter 8). The stages of development denoted by each number are described in table 3-1 below.

Table 3-1: Uwe Meier, 1997: Growth Stages of Mono- and Dicotyledonous Plants. Federal Biological Research Center for Agriculture and Forestry (Editor)

00	Dry seed
10 - 11	Leaf development (youth stage), Seedling
35 - 39	Rosette growth: leaves cover 50% - 90% of ground
40 - 45	Development of harvestable vegetative plant parts – Beet root
49	Beet root has reached harvestable size

3.4 Method of Observation

The method of observing the characteristic is indicated by the following key in the Table of Characteristics:

- MG: single measurement of a group of plants or parts of plants
- MS: measurement of a number of individual plants or parts of plants
- VG: visual assessment by a single observation of a group of plants or parts of plants
- VS: visual assessment by observation of individual plants or parts of plants
- TQ: the characteristic is adopted from the TQ as informed by the applicant

4 Test Design

Two DUS trials are elaborated in each growing period – one field trial with spaced plants for visual assessments and measurements of harvested roots – and one greenhouse trial for observing germinity of the seeds and anthocyanin coloration of hypocotyl.

4.1 Field trial

The field trial is elaborated in an Alpha design in 3 replicates. The ordinary field trial is enlarged with a fourth replicate where all second-year candidates are visually compared in side-by-side plots with the (typically 2) most similar varieties established from the first year of DUS-testing.

Each plot is 4 meters long and 2 meters wide and consists of 4 rows. The trial is drilled ensuring that, after thinning, there is approximately 18 cm between the plants. The two middle rows are harvested for measuring of the roots in the laboratory.

In each plot there are at least 80 plants and in the field test at least 240 plants.

For all candidate varieties off-type plants are registered and removed from each plot in the field before harvest.

4.2 Greenhouse test

The greenhouse test has the same randomization as the field trial, but only 2 replicates with at least 50 plants per replicate.

5 Assessment of Distinctness, Uniformity and Stability

5.1 Distinctness

For distinctness, COY D is applied on all quantitative characteristics except for the greenhouse characteristic anthocyanin coloration of the hypocotyl where minimum distance is applied. For qualitative and pseudo-qualitative characteristics, minimum distance is applied.

For COY D a variety is considered distinct if a single characteristic shows significant differences at 1 % level, or two independent characteristics show significant differences at 5 % level.

If varieties are grown side-by-side and a clear difference in one or more characteristics is observed in a direct comparison, the two varieties are considered distinct.

5.1.1 Number of Plants / Parts of Plants to be Examined

Unless otherwise indicated, for the purposes of distinctness, all observations on single plants should be made on 45 plants for candidate varieties, 30 plants for reference varieties or parts taken from each of 45 plants for candidate varieties and 30 plants for reference varieties, divided on and taken from 3 replicates, and any other observations made on all plants in the test, disregarding any off-type plants.

All observations in the greenhouse trial are determined by measurement or counting and is made on at least 100 plants or parts of plants divided on and taken from 2 replicates.

5.2 Uniformity

For measured characteristics (MS) COY U is applied for testing the relative uniformity of the varieties.

For Hypocotyl: Percentage of seedlings with anthocyanin coloration of hypocotyl, a variety is considered uniform if the expression differ less than 3 notes between growing cycles.

For Germinity in the greenhouse trial and for visually assessed characteristics in the field trial (VG):

A candidate will be considered to be sufficiently uniform if the number of off-types in each growing cycle does not exceed the threshold indicated in table 5-1 below based on a population standard of 2% with an acceptance probability of 95%.

Table 5-1 Threshold for off-types (pop.std. 2%, acc.prob. 95%)

NUMBER OF PLANTS	OFF-TYPES ALLOWED
100 – 131	5
132 – 165	6
166 – 200	7
201 – 236	8
237 – 273	9
274 – 310	10
311 – 348	11
349 – 386	12

5.3 Stability

A variety is considered stable if it is sufficiently uniform.

6 Grouping of Varieties

The following have been agreed as useful grouping characteristics:

Germinity – Char. 1

Ploidi – Char. 2

7 Introduction to the Table of Characteristics

7.1 States of Expression and Corresponding Notes

States of expression are given for each characteristic to define the characteristic and to harmonize descriptions. Each state of expression is allocated a corresponding numerical note for ease of recording of data and for the production and exchange of the description.

All relevant states of expression are presented in the characteristic.

7.2 Example Varieties

Where appropriate, example varieties are provided to clarify the states of expression of each characteristic.

8.1 Explanations

8.1.1 Ad 1: Germinity

2 x 50 seeds from the submitted sample (growth stage 10-20) are assessed. The germinity is then assessed on a scale from 1 to 2 by counting the number of sprouts per seed cluster.

1 – monogerm, one sprout per seed cluster

2 – multigerm, more than one sprout per seed cluster

If 95 % or more are assessed as 1 – the variety is monogerm

If 95 % or more are assessed as 2 – the variety is multigerm

8.1.2 Ad 3: Hypocotyl: percentage of seedlings with anthocyanin coloration of hypocotyl

2 x 50 seeds from the submitted sample (growth stage 10-20) are assessed.

Assessment by counting the number of seedlings with anthocyanin coloration of hypocotyl. The following colors are counted as anthocyanin coloration: red, orange, pink.

8.1.3 Ad 4: Leaf: attitude

Leaf: attitude is assessed on a scale from 1 to 9 on the second outermost leaf wreath on the beet. If the leaves are standing upright, a grade of 1 (erect) is given. If the leaves form an approximately 45-degree angle with the ground, a grade of 5 (intermediate) is given. If the leaves predominantly lie along the ground, a grade of 9 (prostrate) is given. The entire scale can be utilized.

8.1.4 Ad 9: Leaf length including petiole / 10: Leaf blade: length / 11: Leaf blade: width

Assessed in the field trial (growth stage 40-45).

8.1.5 Ad 12: Leaf blade: width compared to length

Assessed in the field trial (growth stage 40-45).

3 – Narrow

5 – Medium

7 - Broad

8.1.6 Ad 13: Leaf blade: shape of tip

Assessed in the field trial (growth stage 40-45)

- 1 - pointed
- 2 - rounded
- 3 - stump

1

2

3

8.1.7 Ad 14: Root: color below ground

1 - White

3 - Yellow

5 - Orange

7 - Red

8.1.8 Ad 15: Root: shape

Assessed on a scale from 1 to 7 in the field trial.

1 - Spherical

3 - Oval

5 - Conical

7 - Cylindrical

8.1.9 Ad 16, 17, 19: Root: length, width and height above ground

16 Root: length: To measure between the root tip at 2 cm diameter and the top cut (which is made at the base of the green petioles).

17 Root: width: To measure at the broadest extension of the root, parallel to the top cut.

19 Root: height above ground: Is measured from where the root changes color above ground (ground surface - typically the mechanical mark, left from the machine lifting the roots in the field can be used as guide) to the top cut.

8.1.10 Ad 18: Root: length compared to width

Must be calculated as the ratio Root: length divided with Root: width.

8.1.11 Ad 20: Root: ratio above ground

Must be calculated as ratio Root: height above ground divided with Root: length.
